The threshold for high quality sequence is 5.0. Three-prime sequences, which are obtained with PolyTMix or T7 sequencing primer, are presented as the reverse complement. Seq primer: T7
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Cordonnier-Pratt, M.-M., Gingle, A., Marsala, C. and Pratt, L. H. Cordonnier-Pratt, M.-M., Gingle, A., Marsala, C. and Pratt, L. H. Targat database from Sorghum: light-grown seedlings

Library constructed by Dr. Yutaka Suzuki and Dr. Sumio Sugano in
the Human Genter, University of Tokyo Institute of Medical
Science; plant material and RNA prepared at Texas A & W University;
sequencing done in the Laboratory for Genomics and Bioinformatics,
University of Georgia. Sequence ends have been trimmed to exclude
vector and regions below Phred quality 16. Three-prime sequences
are presented as their reverse complement and have been trimmed to
exclude polyA.

```
This is the nucleotide sequence of ribozyme deltaRzPl.1. This ribozyme cleaves substrate SPl.1 (see AAZS7641). The invention relates to a nucleic acid enzyme (e.g. deltaRzPl.1) that is constructed to have a substrate binding portion with the following sequence 3'-UNXNNN-5'. The substrate of the enzyme (ribozyme) base pairs to 6 nucleotides 3' to the cleavage site of the substrate (cleavage site is represented by *). At least one nucleotide is present 5' to the cleavage site of the substrate sequence. The enzyme of the invention is used to cleave a substrate sequence. The enzyme of the invention is used to cleave a substrate nucleotide sequence at a specific cleavage site by mixing the substrate with the enzyme. The enzyme is used to cleave viral RNA or RNA causing for example an inherited disease. The enzymes also have other therapeutic, biotechnological and diagnostic applications
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Trans-acting antigenomic delta ribozyme, deltaRzP1.2 nucleotide sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               /*tag= a

This is the nucleotide sequence of ribozyme deltaRzP1.2. This ribozyme cleaves substrate SP1.2 (see AAZ57634). The invention relates to a nucleic acid enzyme (e.g. deltaRzP1.2) that is constructed to have a cubstrate binding portion with the following sequence 3'-UNNXNN-5'. The substrate of the enzyme (ribozyme) base pairs to 6 nucleotides 3' to the cleavage site of the substrate (cleavage site is represented by *). At least one nucleotide is present 6' to the cleavage site of the substrate sequence. The enzyme of the invention is used to cleave a substrate sequence. The enzyme of the invention is used to cleave a substrate with the enzyme. The enzyme is used to cleave a substrate with the enzyme. The enzyme is used to cleave a substrate with the enzyme. The enzyme also have other therefore is not shown in the specification, but has been derived from the sequence is not shown in the specification, but has been derived from the cleavage round of the round from in figure 1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     /+tag= a

This is the nucleotide sequence bimolecular ribozyme RzA fragment. This ribozyme cleaves substrate SP1.1 (see AAZ57641). The invention relates to an ucleic acid enzyme (e.g. deltaRzPl.1) that is constructed to have a substrate binding portion with the following sequence 3'-UNNXNN-5'. The substrate of the enzyme has the sequence 5'-H'*GNNHNN-3'. The binding portion of the enzyme (ribozyme) base pairs to 6 nucleotides 3' to the cleavage site of the substrate (cleavage site is represented by *). At least one nucleotide is present 5' to the cleavage site of the substrate sequence. The enzyme of the invention is used to cleave a substrate nucleotide sequence at a specific cleavage site by mixing the substrate with the enzyme. The enzyme is used to cleave viral RNA or RNA causing for example an inherited disease. The enzymes also have other therapeutic, biotechnological and diagnostic applications
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Substrate; self-cleaving sequence; HDV; hepatitis delta virus; enzyme;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                         This is the nucleotide sequence of a trans-acting antigenomic delta ribozyme of the invention. This ribozyme cleaves substrate SP1.1 (see AAZ57641). The invention relates to a nucleic acid enzyme (e.g. deltaZ2P1.1) that is constructed to have a substrate binding portion with the following sequence 3'-UNNXNN-5'. The substrate of the enzyme has the sequence 5'-H'*GNNHNN-3'. The binding portion of the enzyme (ribozyme) hase pairs to 6 nucleotides 3' to the cleavage site of the substrate of cleavage site is represented by *). At least one nucleotide is present 5' to the cleavage site of the substrate sequence. The enzyme of the invention is used to cleave a substrate nucleotide sequence at a specific cleavage site by mixing the substrate with the enzyme. The enzyme is used to cleave a substrate with the enzyme. The enzyme is used coleave a substrate with the enzyme. The enzyme is used enzymes also have other therapeutic, biotechnological and disanostic applications. (Updated on 15-SEP-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               /bound_moiety= "RzB fragment of bimolecular ribozyme" /notes= "Forms double-stranded region with bases 20-16 of sequence AAZ57640"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       /bound moiety= "Ribozyme substrate P1.1"

New isolated cancer associated nucleic acids comprising at least 10 contiguous nucleotides, useful for diagnosing, preventing and/or treating cancers such as leukemia and lymphoma.
                                                                                                                                                                                                                                                                                                                        The present invention relates to cancer associated sequences (ADQ97025-ADQ98004). The sequences are useful for the diagnosis, prevention and/or treatment of cancer, such as leukemia and lymphoma. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic formate directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequence 138627 BP; 33083 A; 34745 C; 35023 G; 35281 T; 0 U; 495 Other;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The self-cleaving sequences from genomic and antigenomic HDV can be used to develop enzymatic RNA mols. with similar properties. ADC3 is a smaller version of ADC1 (AAQS3138), wherein stem IV is shortened. Such a smaller enzymatic RNA has simplified synthesis and the potential for higher enzymatic activity due to a higher probability that a small RNA will fold into an enzymatically active structure. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Nucleic acid molecule having RNA substrate-cleaving enzymatic activity useful for cleaving specific target molecules in=vitro.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

                                                                                                                                                                                                                                                                              ઠે
                                                           A dengue virus recombinant replicon has a deletion of the complete coding sequence for prem protein of dengue virus and also includes elements of c.g. the non-coding region in the whole of the 5'-end, the coding region of the front 20 amino acids in the C protein, and the coding region of NS1 protein signal; coding regions of all non-structural proteins. The obtained vaccines are useful in producing preventives or/and remedies for cancer like cervical cancer and viral diseases. Such vaccines can efficiently express antigen in infected cells, which is because dengue virus can infect dendritic cells, and can effectively present antigen to provide immunity effect. Different types of dengue virus can be used to repeatedly produce efficient immune response thereby strengthening the body's immune system against the pathogen that contains such antigen. Human papillomavirus (HPV) vaccines were prepared by using a generapressing system using of the full-length dengue virus cDNA clone (PRS/FLD2). The recombinant virus vectors were transfected into baby haster kidney (BHK) cells to enable the screening of BHK-21 Tet-off cell innes. This sequence corresponds to an oligonucleotide used in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Bivalent vaccines for preventing and treating Japanese (B) encephalitis and hepatitis B produced by recombinant technique using encephalitis B virus as vector to express antigen gene of hepatitis B.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Virucide; Japanese encephalitis B virus; bivalent vaccine; hepatitis B;

The amplified DNA sequences were used in the construction of a eukaryotic layered vector initiation system (ELVIS) derived from Sindbis. ELVIS's comprise a 5' sequence apable of initiating transcription of an alphavirus, a nucleotide sequence encoding alphavirus non-structural proteins, a viral junction region which has been inactivated such that privial transcription of the subgenomic fragment is prevented, and an alphavirus RNA polymerase recognition sequence. Inactivation of the viral junction region prevents transcription of the subgenomic fragment making vectors such as this suitable for a wide variety of applications, eg. 2003 to correct PN field.)
genome is inserted with an exogenous nucleotide sequence for recombination and capable of retaining its self-replication function. The virus is useful in producing the bivalent vaccines for preventing and treating Japanese (B) encephalitis and hepatitis B. Such vaccines are producible at low cost and have high immunoefficiency, in which the recombinant virus can efficiently express the antigen of hepatitis B virus with the safety and immunogenicity of attenuated encephalitis B virus vaccines. The current sequence represents a PCR primer used in an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Bukaryotic layered vector initiation system; Sindbis; alphavirus; PCR; transcription initiation; non-structural protein; subgenomic fragment; RNA polymerase recognition sequence; ELVIS; gene therapy; amplify; primer; polymerase chain reaction; cystic fibrosis; ss.

Primer HDV17-68 (AAT31151) is based on hepatitis delta virus (HDV) nucleotides 839-887. It was used with reverse primer HDV49-XC (AAT30850) for the PCR amplification of HDV sequences. A second primer pair, SIN-HDV (AAT31152) and SIN276-SPE (AAT31153), is used to amplify a fragment contg. Sindbis 5'-end sequences fused to HDV sequences. Overlapping synthesis is used in a second round of PCR using primers HDV49-XC and SIN276-SPE. The resulting construct contains the expression cassette elements HDV ribozyme/Sindbis 5'-end 299 nts/Sindbis junction region/Sindbis structural protein genes/Sindbis 3'-end untranslated region/ Gasignated pS5'-Ses. This was inserted into pcDNA3. Packaging cell line cassettes were constructed that allow inducible expression of structural proteins via alphavirus vectors
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New recombinant alpha-virus vectors - used to develop prods and methods for use in gene therapy and in the prodn. of vaccines.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The sequences given in AAQ86200-15 are primers which were used in the production of alphavirus vectors expressing multiple heterologous genes. These vectors are eukaryotic layered vector initiation systems (ELVIS) derived from Sindbis. ELVIS's comprise a 5' sequence capable of initiating transcription of an alphavirus, a nucleotide sequence encoding alphavirus non-structural proteins, a viral junction region which has been inactivated such that viral transcription of the subgenomic fragment is prevented, and an alphavirus RNA polymerase recognition sequence. Inactivation of the viral junction region prevents transcription of the variety of applications, eg. gene therapy for the treatment of cystic fibrosis. (Updated on 25-MAR-2003 to correct PN field.)

                                                                                                                                                                                                                                                 primer SHDVIF (AAT30816) contains a buffer sequence allowing enzyme digestion, a SacI site, and a hepatitis delta virus (HDV) ribozyme sequence. It was used with nested primer HDV17-68 (AAT30817) and reverse primer SHDV84R (AAT30818) to generate an HDV ribozyme. This antigenomic ribozyme can be placed between the polyA tract at the 3' end of a Sindbis virus-based eukaryotic layered vector initiation system, ELVIS, and the transcription terminal signals to produce alphavirus expression vectors useful in methods of gene therapy and for vaccine produ
                                                                                                                                                                                                       recombinant alpha-virus vectors - used to develop prods and methods use in gene therapy and in the prodn. of vaccines.

pCR primers AAV42367-420 and AAV42422-54 are used in the course of the invention. The specification describes a DNA alphavirus structural protein expression cassette which comprises an inducible promoter and an alphavirus structural protein gene, where the promoter directs the expression of the alphavirus structural protein gene upon induction of the promoter within a cell, and where prior to induction within the cell, the expression cassette does not express sufficient quantities of structural proteins to be cytocoxic to a BHK cell containing the expression cassette. The products may be used to inhibit pathogens and

invention. The specification describes a DNA alphavirus structural protein expression cassette which comprises an inducible promoter and an alphavirus structural protein gene, where the promoter directs the expression of the alphavirus structural protein gene upon induction of the promoter within a cell, and where prior to induction within the cell, the expression cassette does not express sufficient quantities of structural proteins to be cytotoxic to a BHK cell containing the expression cassette. The products may be used to inhibit pathogens and stimulate an immune response
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Eukaryotic layered vector initiation system - containing eukaryotic promoter and heterologous antigen coding sequence, useful for stimulating

PCR primers AAV60153-55 are used to amplify Hepatitis delta virus ribozyme sequence. The product is used in the course of the invention. The specifiaction describes an eukaryotic layered vector initiation system, based on Sindbis The eukaryotic layered vector initiation system comprises a eukaryotic promoter 5' of viral cDNA which initiates, in a susceptible target cell, 5' to 3' synthesis of RNA from the viral cDNA. The RNA comprises a vector construct which autonomously amplifies in the

```
cell and expresses a heterologous nucleic acid sequence which encodes an
              antigen or modified form that stimulates an immune response within an animal. The system is useful for stimulating an immune response to an antigen by introducing the vector into target cells, preferably by infection in vivo, especially where the immune response is a cell mediated, HLA class I restricted or an HLA class II restricted immune response. (Updated on 25-MAR-2003 to correct PR field.)

Patent No. 5843723
GENERAL INFORMATION:
GENERAL INFORMATION:
APPLICANT: Polo, John M.
APPLICANT: Polo, John M.
APPLICANT: Chang, Stephen M.W.
APPLICANT: Belli, Barbara A.
APPLICANT: Belli, Barbara A.
TITLE OF INVENTION: EUKARYOTIC LAYERED VECTOR INITIATION SYSTEMS AND ALPHAVIRUS NUMBER OF SEQUENCES: 128
CORRESPONDENCE ADDRESS:
ADDRESSES: SEED and BERRY LLP
                         APPLICANT: Polo, John M.
APPLICANT: Lbanez, Carlos E.
APPLICANT: Chang, Stephen M.W.
APPLICANT: Chang, Stephen M.W.
APPLICANT: Jolly, Douglas J.
APPLICANT: Belli, Barbara A.
APPLICANT: Belli, Barbara A.
TITLE OF INVENTION: EUKARYOTIC LAYERED VECTOR INITIATION SYSTEMS AND ALPHAVIRUS NUMBER OF SEQUENCES: 128
CORRESPONDENCES: ADDRESS:

Sequence 40, Application US/09350399
Patent No. 6342372
GENERAL INFORMATION:
GENERAL INFORMATION:
Discrete Paris W
Polo, John M.
Jolly, Douglas J.
TITLE OF INVENTION: EUKRRYOTIC LAYERED VECTOR INITIATION SYSTEMS
NUMBER OF SEQUENCES: 128
CORRESPONDENCE ADDRESS:
ADDRESSEE: SEED and BERRY LLP
STREET: 6300 Columbia Center, 701 Fifth Avenue
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    .

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              DB 3; Length 52;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            CITY: Seattle
STATE: Washington
COUNTRY: US
ZIP: 98104-7092
COMPUTER READABLE FORM:
MEDIUM TYPE: Floppy disk
COMPUTER: IBM PC compatible
CORPUTER: DATENTIN PC compatible
SOFTWARE: Patentin Release #1.0, Version #1.25
CURRENT APPLICATION DATA:
APPLICATION NUMBER: US/09/350,399
FILING DATE: 08-311-1999
CLASSIFLATION:
ATTORNEY/AGENT INPORMATION:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    NAME: McMasters, David D.

normalized libraries (melanocyte 2NbHM, pregnant uterus NbHPU, and fetal heart NbHH19W) were made in vitro. Pollowing HAP purification, this DNA was used as tracer in a subtractive hybridization reaction. The driver was PCR-amplified cDNAs from pools of 5,000 clones made from the same 3 libraries. The pools 340488-345479, and 484488-489479."

/note="Organ: leaf; Vector: RescueMu (engineered from pBlueScript backbone); Site !: BamH1, Site 2: BBlII;
RescueMu is a 4.9 kb, modified maize Mu transposon designed to allow plasmid rescue from total genomic DNA.
Mu elements insert preferentially into transcription units. For more information on RescueMu, go to the web site 'www.zmdb.isastate.edu' and follow the links for 'RescueMu.' Grid H was grown at Berkeley in 2001. DNA was extracted from leaf punches, double digested using BamH1 and BglII, and ligated to form circular plasmids. DH108 cells were transformed and then screened on LB plates with ampicillin."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö

/note="Vector: pBluescriptkS(+); Site_1: NotI; Site_2:
NotI; Genomic DNA was digested with NotI and the resulting
fragments were ligated into ZADII/NotI vector DNA. After
the digestion with EcoRy, the mixture was run on o.8t LMP
agarose gel, eluted a gel portion over 22 kb and purified
with beta-agarase I. The purified DNA was digested with
NotI, run on 1t LMP agarose gel, and eluted with Gel
Extraction kit the DNA fragments ranging 0.7 to 4 kb,
which cover on first-dimensional gel comprising the
central portion of the standard RLGS profile. The DNA
solution was ligated into pBluescript KS(+) with NotI
ends. The ligated solution was transformed into DH5a cell
using electroporation machine."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              An Arabidopsis thaliana T-DNA mutagenized population (GABI-Kat) for flanking sequence tag-based reverse genetics Plant Mol. /note="Vector: pCR-TOP02.1; Cloned 5' RACE fragments
amplified from 5' RACE cDNA generated from 15 pooled mouse
tissues and stages: 7, 11, 15, & 17-day total embryo,
whole brain, eye, kidney, liver, lung, prostate,
submaxilary gland, smooth muscle, spleen, testes and
It indicates an insertion close to or within gene At5g61790. Details on the protocols used for generation of the sequence are described in References 1-3. The sequences are generated at the MPI for Plant Breeding Research in the context of the GABI-Kat project GABI-Kat is part of the German Plant Genomics program designated 'GABI'. Information on line availability can be found at: Location/Qualifiers
                                                                                                                                                                                                                                                                                                                                                                            /note-incr was performed on DNA from Arabidopsis thaliana plants (TI) which were transformed with the T-DNA from vector pAC161 (GenBank accession number: AJ537514). The lines contain one or more T-DNA insertions. The DNA fragment(s) resulting from the PCR were directly sequenced to determine the genomic sequence flanking the insertion. T-DNA derived sequences were removed.

/note="A human T-cell line (SupT1) was infected with an HIV-based vector. DNA was isolated and cleaved with an HIV-based vector. DNA was isolated and cleaved with restriction enzymes; linkers were ligated onto the cleaved DNA and DNAs were amplified using one primer that bound to the linker DNA and one that bound to the HIV cDNA. Junctions between integrated HIV proviruses and cellular DNA were cloned and sequenced."

Library constructed by Bento Soares and M.Fatima Bonaldo. The adult brain RNA was provided by Dr. Donald H. Gilden. Tissue was acquired 17-18 hours after death which occurred in consequence of ruptured aortic aneurysm. RNA was prepared from a pool of fissues representing the following areas of the brain: frontal, parietal, temporal and occipital cortex from the left and right hemispheres, subcortical white matter, madalla, thalamus, cerebellum, midbrain, pons and
